Brian Collins
Lab 6

1.   Internationalization involves coding in a special way such that code can be easily adapted to use other language preferences. Localization adapts internationalized software to be used with one specific language preference.

2.   If code was not internationalized then every minute language detail would have to be corrected whenever a product is to be used in a region with a different language or culture. Programs to be used in a specific region must be localized to that area or they will not be understood or accepted.
